Texas A&M construction science team drafts new home building and performance standards for state of Texas

Charles H. Culp

Held for 25 years, Culp has over 25 years of experience and is a leading researcher in the field of construction science. His work has been published in numerous journals and he has received numerous awards for his contributions to the field. As faculty fellow at A&M's Center for Housing and Urban Development, he has contributed to the development of new construction standards. He recently received funding to support his research on the performance of new homes.

Chanam Lee

An assistant professor of environmental health at A&M, Chanam Lee is currently working on two new books. Her research focuses on the impact of the built environment on health, with a particular interest in activity-friendly communities. She has published numerous articles in leading journals and her work has been presented at national and international conferences.

Srikanth Raman

A former student of A&M's doctoral program in civil engineering, Raman has been a key contributor to the development of new home building and performance standards. As a student, he worked with his advisor on the development of the comprehensive science department in the state of Texas. His work has been mutually beneficial and it appears that the research we have performed is directly in line with the classes we teach and it complements our work in the field.

Bonfire Memorial designed to elicit viewer participation

The statue was designed by the Texas A&M College of Architecture to commemorate the 12 students who lost their lives in the tragic Aggie Bonfire accident of 2003. The memorial is intended to address, if not preempt, problems with the existing structures, such as the use of temporary structures for construction that be-

Sustaining China
Texas A&M College of Architecture collaborating with China’s Tsinghua University to promote healthy cities

The facility at Texas A&M’s College of Architecture have a great deal in common with their academic counterparts at Tsinghua University in Beijing, China — especially their desire to positively transform beleaguered urban environments, and design and construct modern, healthy cities with promising, sustainable futures.

Building on the “High Line” — the elevated parks, plazas and gardens that were eventually transformed into a signature walkway and urban amenity in New York City — this project seeks to regenerate and expand the urban fabric of a neighborhood in the heart of Beijing. It will create a network of public spaces, parks and plazas that serve as an extension of the city’s urban fabric and provide a venue for social interaction and cultural events.

The project concept is based on the idea of a “living city” that integrates green infrastructure and urban planning strategies to create a sustainable and resilient urban environment. The design seeks to create a network of public spaces, parks and plazas that serve as an extension of the city’s urban fabric and provide a venue for social interaction and cultural events.

The project will also include the creation of a new park in the area, which will serve as a green buffer between the existing buildings and the proposed new development. The park will feature a variety of open spaces, including a central plaza, pedestrian pathways, and seating areas.

The project is expected to be completed by 2025 and will serve as a model for sustainable urban development in China and beyond.

A&M Head Start
Interdisciplinary background guides Ndubisi’s leadership of Department of Landscape Architecture & Urban Planning

A new book provides an introduction to landscape architecture and urban planning, and explores how these fields can be used to address some of the most pressing issues facing modern cities. The book, titled “Landscape Architecture and Urban Planning: An Introduction,” is authored by A&M’s Ndubisi Nwubisa, who is the director of the college’s Landscape Architecture and Urban Planning Department.

The book provides a comprehensive overview of the field of landscape architecture and urban planning, and explores how these fields can be used to address some of the most pressing issues facing modern cities. The book covers a wide range of topics, including the history of landscape architecture and urban planning, the role of design in shaping the built environment, and the challenges of urbanization and climate change.

The book is organized into five parts, each of which focuses on a different aspect of landscape architecture and urban planning. The first part provides an introduction to the field, and explores how landscape architecture and urban planning can be used to create more sustainable and livable cities.

The second part covers the history of landscape architecture and urban planning, and explores how these fields have evolved over time. The third part focuses on the role of design in shaping the built environment, and explores how landscape architects and urban planners can use design to create more livable and sustainable cities.

The fourth part covers the challenges facing modern cities, and explores how landscape architecture and urban planning can be used to address these challenges. The fifth part provides an overview of the future of landscape architecture and urban planning, and explores how these fields are likely to evolve in the years to come.

The book will be available for purchase later this year, and is expected to be a valuable resource for students, professionals, and anyone interested in landscape architecture and urban planning.
